Numpy

- Importing
- Numpy Array: Indexing, Slicing, Reshaping
- Numpy Functions

tuteur.py@gmail.com

Gaurav Gupta

What is Numpy

NumPy is the fundamental package for scientific computing with Python. It contains among other things:

- a powerful N-dimensional array object
- sophisticated (broadcasting) functions
- tools for integrating C/C++ and Fortran code
- useful linear algebra, Fourier transform, and random number capabilities

Gaurav Gupta

Numpy import and numpy array

- **import numpy as np**
- Uses a datatype: **ndarray**
- Data in these arrays is homogeneous.

- Can be created via the following function:
  - array(<some sequence>, dtype):

tuteur.py@gmail.com

Gaurav Gupta

Data Types

- np.int8, np.int16, np.int32, np.int64
- np.uint8, np.uint16, np.uint32, np.uint64
- np.float32, np.float64

Source: numpy.org

Gaurav Gupta

More on Data types

- '?' *boolean*
- 'b' *(signed) byte*
- 'B' *unsigned byte*
- 'i' *(signed) integer*
- 'u' *unsigned integer*
- 'f' *floating-point*
- 'c' *complex-floating point*
- 'M' *datetime*
- 'O' *(Python) objects*
- 'U' *Unicode string*

The first character specifies the kind of data and the remaining characters specify the number of bytes per item,

Array Creation

- arange(start, end, step)
- Random.randint(start, end, size = <no of elements>) # default gives one no.
- linspace(start, end, count)
- zeros(shape) # shape single arg or tuple of shape
- ones(shape)

tuteur.py@gmail.com

Gaurav Gupta

Numpy Array slicing-indexing

- Slicing works similar to normal lists

  array[<row index/slice>, <column index/slice>]

  Ex:

  array[1:4, [3,4]]

- For multidimensional slicing user the comma syntax:

  array[dim1, dim2, dim3, ...]

Gaurav Gupta

Numpy Operations and Aggregate Functions

- Supports: *, /, -, % etc. Behavior depends on operands
- Relations Operations return matrices of Booleans which can be used as indexes >, <, >=, <=
- Min, max, sum, mean
- These take ***axis*** as argument which denotes 0 (column wise), 1(row wise) and so forth for multiple dimensions.
- *any(), all(), np.isnan(<array>)*

Gaurav Gupta

Numpy Filtering out data

- Use the **where** function
- Where takes a Boolean matrix as argument and returns a two arrays containing row and column indexes.
- This can be used as an index into the original array.
- *index = np.where((array > x) & (array < y))*
  elements = array(index)

tuteur.py@gmail.com

Gaurav Gupta

Looping and Stacking

- Use vstack or hstack.
- The dimensions must be aligned before stacking can be done.

Gaurav Gupta

Pandas

- Importing
- Series and DataFrame

tuteur.py@gmail.com

Gaurav Gupta

Import and Series and DataFrame

- **import pandas as pd**

- Data Types:
  - Series(1-D) : Homogeneous. Behaves like a list
  - DataFrame(2-D) : Heterogeneous Columns

tuteur.py@gmail.com

Gaurav Gupta

Series and DataFrame

- Series(<sequence>, index, dtype)
  - *Series([1, 3, 5, np.nan, 6, 8])*
- DataFrame (<data object>, *[index=], [columns=]*)
  - *df = pd.DataFrame(np.random.randn(6, 4))*
  - pd.DataFrame({'A': 1.,....:'C': pd.Series(1, index=list(range(4)), dtype='float32'),
    'D': np.array([3]*4, dtype='int32'),
    'E': pd.Categorical(["test", "train", "test", "train"]),
    'F': 'foo'})

tuteur.py@gmail.com

Gaurav Gupta

Data Frame attributes and viewing data

- Attributes:
  - shape,
  - dtypes
  - columns
  - index
- Viewing:
  - head() : view top few rows
  - tail() : view last few rows
  - describe() : view stats about the data

tuteur.py@gmail.com

Gaurav Gupta

DataFrame slicing, indexing or viewing

- df[<index>] : gives a column
- df[start: end] : slices on rows

- To index or slice rows and columns use *loc* or *iloc*.
- loc[start:end, ...] : slices on basis of
  slices on row and column label; indexes can be a list as well.
- iloc[start: end, start:end]
  iloc[< list of row indexes>, <list of column indexes>]
  slices via indexes

tuteur.py@gmail.com

Gaurav Gupta

Operations and Aggregate Functions

- Supports: *, /, -, % etc.
  Behavior depends on operands
- Relations Operations return matrices of Booleans which can be used as indexes
  >, <, >=, <=
- Min, max, sum, mean
- These take ***axis*** as argument which denotes 0 (column wise), 1(row wise) and so forth for multiple dimensions.

tuteur.py@gmail.com

Gaurav Gupta

Functions

- <series>.value_counts()
  Returns frequency of each type in the Series
- apply(lambda)
  applies the lambda or function to a row or a column
  similar: applymap (acts elementwise)
- replace()
  Replace data, using dictionary, list of original and new values or regex
- rename() : Rename row and column indexes

tuteur.py@gmail.com

Gaurav Gupta

Checking NaN Functions

- isna()
- fillna()
- dropna()
- isnull()
- any()
- all()

tuteur.py@gmail.com

Gaurav Gupta

Grouping and sorting

- groupby(<list of columns>)

  get_group(<tuple of filter values>)

- Once grouped, functions can be applied on the grouped column labels

tuteur.py@gmail.com

Gaurav Gupta

Importing and Dumping Datasets

- read_csv(<file name>)
- read_excel(<file name>, skiprows=<number>, sheet_name=<name of sheet>)
- to_csv(<file name>, [index=True/False])
- to_excel() # requires pd.ExcelWriter

tuteur.py@gmail.com

Gaurav Gupta

Matplotlib

- Importing and simple plots
- Labelling
- Useful functions
- Histogram, Pie
- Bar, Scatter

tuteur.py@gmail.com

Gaurav Gupta

Import and Simple plot

- **import matplotlib.pyplot as plt**
- plot (<xabel>, <ylabel>, <color, symbol options>)
- Ex:
  plot([1,2,3], [1,4,9], 'ro')
- show()
  displays all plots.
  Multiple plot calls plot on the same graph.
- figure()
  open a new figure window

tuteur.py@gmail.com

Gaurav Gupta

Plotting multiple plots

- subplot(r, c, curr_pos)
- Used to plot multiple graphs in same figure
- Creates a grid of size ***r*x*c***
- Must be called before any kind of plotting function
- ***curr_pos*** determines the position of current graph in the grid

tuteur.py@gmail.com

Gaurav Gupta

Some useful functions

- xlabel()
  label on x-axis
- ylabel()
  label on y-axis
- xticks(), yticks() : rotation
  specify markers on x and y axis
- legend()
  requires labels to set while plotting
- title()
  title for the graph

tuteur.py@gmail.com

Gaurav Gupta

Extra functions

- text(x, y, value) : Inserts a single text element; requires loop otherwise
- stem(x,y)
- fill_between(x, y) : Area filled by color
- savefig(<filename>)
- axvline(x) : draw vertical line
- axhline(y) : draw horizontal line

tuteur.py@gmail.com

Gaurav Gupta

Histogram, Pie

- hist:
  - bins : integer
  - rwidth : float [0 - 1.0]
- pie(data):
  - shadow : Boolean
  - labels, labeldistance
  - explode : [list of floats]

tuteur.py@gmail.com

Gaurav Gupta

Barplot, Scatter

- bar(x, values):
  - label : Used by legend option
  - bottom: used to create stacked bar plot
- Scatter:
  - color : string
  - s : integer size
  - alpha : float [0 – 1.0]
  - marker: o,_,^, $...$

tuteur.py@gmail.com

Gaurav Gupta

Image, boxplot, tiwnx

- imshow
- boxplot(data):
  - data : can be array or a matrix for multiple plots
- twinx:
  - replicates a different y-axis keeping same x-axis
  - no args required

tuteur.py@gmail.com
